

# RIP & RIS Condenser Bushings

Insulation: Resin Impregnated Paper (RIP) &

Resin Impregnated Synthetic (RIS)

Application: Transformer - Outdoor

Type: Oil to Air

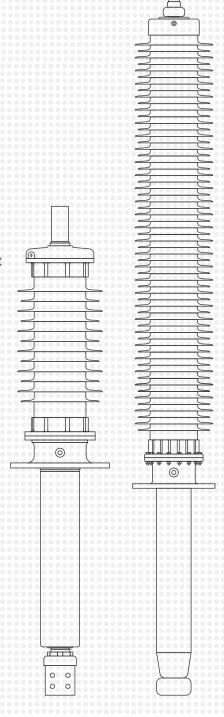

Insulator: Hollow Composite / Silicon

Rated Voltage: 24 kV - 245 kV Rated Current: 400 A to 3150 A\*

Standard: IEC 60137:2017

\*Customized Rated Current > 3150 A are available upon request

## Salient Features

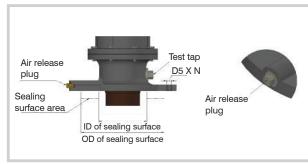

- · Oil free / Partial discharge free
- · Non-flammable, self-extinguishing when exposed to open fire
- Excellent seismic / earthquake performance
- High thermal strength (120°C)
- Mechanically rigid, yet lightweight and compact, with a weight that is 50% of the OIP
- · Can be transported, stored & installed at any angle
- · Can be energized immediately after installation
- Seals the transformer & reduces downtime in the event of major failures
- · Shatter-proof, hydrophobic silicone sheds

# Swiss Technology, with Indian Reliability

- A 100-year-old Swiss based company researched a way to increase the dielectric characteristics of the high voltage equipment & invented the Resin Impregnated Paper (RIP) Technology in 1958. They have since supplied thousands of RIP bushings upto 362 kV voltage class globally.
- YASH HIGHVOLTAGE LTD. localised the manufacturing of RIP bushings under a technological collaboration with the Swiss based company in 2016, & has executed more than 12,000 units of RIP bushings from India for many discerning end users and OEMs.
- For RIP & RIS bushings, the condenser core is built with resin impregnated paper, and resin impregnated synthetic insulation, respectively. The insulation is built directly on the conductor (rod or tube based on the current requirement) & consists of high quality crepe paper, wound on the conductor in case of RIP bushings, or special grade synthetic fabric in case of RIS bushings. Conductive grading layers are embedded during the paper / synthetic wrapping to form a capacitive core for the best electrical field control. This guarantees the highest level of operational and human safety.
- The wound core is then dried under vacuum & is impregnated with special grade resin. Thus the temperature class of RIP & RIS bushings is class E (i.e. permissible temperatures of max. 120° C). After the condenser core is completely impregnated with resin & completely cured, the core is machined to suit the design requirements.
- The test tap lead & test tap terminal are moulded with special grade resin system between the mounting flange & condenser core. The special resin forms a high strength bond between the flange and the RIP / RIS condenser core. The mounting flange is made of a high strength aluminium alloy. The mounting flange & condenser core joint is leak tested using a helium leak detector.
- The hollow composite (silicone) insulator is then assembled on the air end side with a metal cap on top, along with special sealing rings & thus, the bushing assembly is fixed firmly. The annular space between RIP / RIS condenser core & hollow core insulator is evacuated & completely filled with a special grade insulation foam which dries after curing, thus forming a completely dry composite RIP / RIS bushing solution.
- The bushings are then completely routine tested in accordance with IEC 60137:2017.

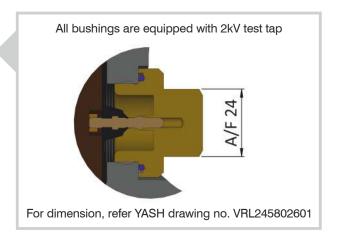

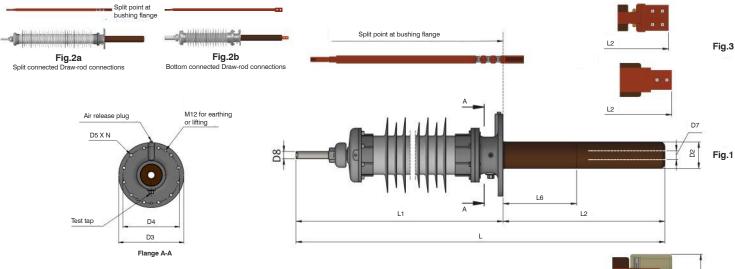

Table 1 - Standard dimensions of RIP/RIS bushings rated 24 kV - 245 kV, current upto 3150 A (All dimensions are in mm)

#### The hollow composite insulator is designed & tested according to IEC 61462.

The composite insulator used by us has:

- Excellent performance in contaminated environment: Silicone-rubber housing with a smooth, hydrophobic surface offers excellent performance in contaminated environments, such as those exposed to sea salt, coastal fog, industrial pollution, agricultural dust, and chemicals etc.
- Excellent tracking resistance under electrical stress.
- Silicone-rubber used has excellent erosion resistance performance in sunlight & UV radiations.
- Lighter weight & easier to handle: Bushings with a composite insulator are lighter in weight compared to bushings with porcelain housing, and therefore less susceptible to handling & transport damage.
- Accidental damage proof: Bushings with composite insulators & silicon rubber housing are explosion-proof, ensuring the highest operational & human safety.

### **Product Range**

**BUSHINGS** 

Rated Voltage 24 kV - 52 kV

Rated Current 4000 A - 25000 A

Standard

IEC-60137:2017 / IEEE C57.19.00/01 /

**Others** 

Communicating / **OIP** condenser

Types Oil filled /

OIP CONDENSER **BUSHINGS** 

Rated Voltage 24 kV - 245 kV

Rated Current Upto 3150 A\*

Standards

IEC-60137:2017 / ANSI / IEEE C57.19.00/01 / Others

Connection

Draw lead / Draw rod / Stem type

Housing

Porcelain / Composite

\*Customized rated current >3150A are available upon request

**OIP WALL BUSHINGS** - OIL TO OIL **BUSHINGS** 

Rated Voltage 24 kV - 245 kV

Rated Current Upto 3150 A\*

Standard

IEC-60137:2017 / IEEE C.57.19.00/01 / Others

Connection

Draw lead / Draw rod / Solid conductor

Porcelain / Composite silicone-polymer

\*Customized rated current >3150A are available upon request

RETROFIT SOLUTIONS

Interchangeable solutions possible for OIP-OIP, OIP-RIP, OIP-RIS bushings of global reputed makes for up to 245kV.

**NABL** accredited **EHV lab**
